LinkedIn Scout

A tool I built to find who to reach out to at a company, ranked by how well their background matches my resume.

Rishav Dutta, linkedin.com/in/duttarishav
Live app: rishav-linkedin-scout.vercel.app
Code: github.com/rishav-dutta/linkedin-scout
Write-up: rishav-dutta.github.io/linkedin-scout

People at a company, ranked against a resume, with the reason for each score. Sample data.

Role	Timeline	Built with
Solo: product, design and engineering	February 2026 to now	React, n8n, Gemini, Supabase

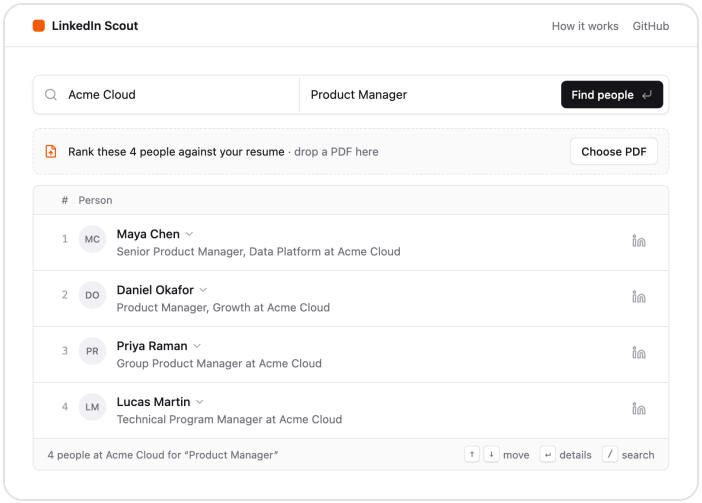

Why I built it

During my MBA job search, networking took most of my time. For every company on my list I searched LinkedIn for people in the team I wanted to join, opened profile after profile, and tried to work out whose background was close enough to mine that a message would get a reply. It was slow, and I was mostly guessing.

I wanted to type in a company and a role and get back a short list of people, in order, with a reason for each one. So I built that.

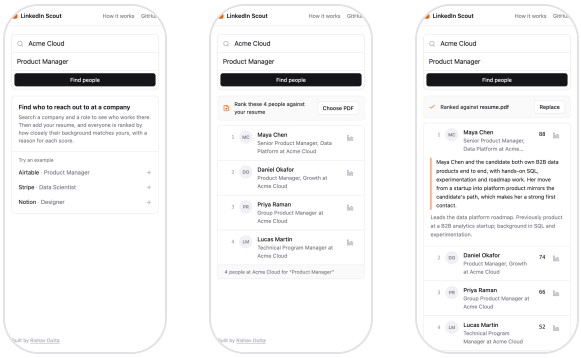

What it does

1. **Search.** Enter a company and a role, for example “Airtable” and “Product Manager”.
2. **See who works there.** Matching LinkedIn profiles show up in about a second. Photos and full profiles fill in over the next few seconds.
3. **Rank them.** Upload your resume as a PDF. Gemini scores each person from 0 to 100 against it and writes a sentence or two on why. The list re-sorts by score.

Right after a search: the people it found, before a resume is added. Sample data.

It works on phones too.

Search, people found and ranked matches on a phone. Sample data.

How it works

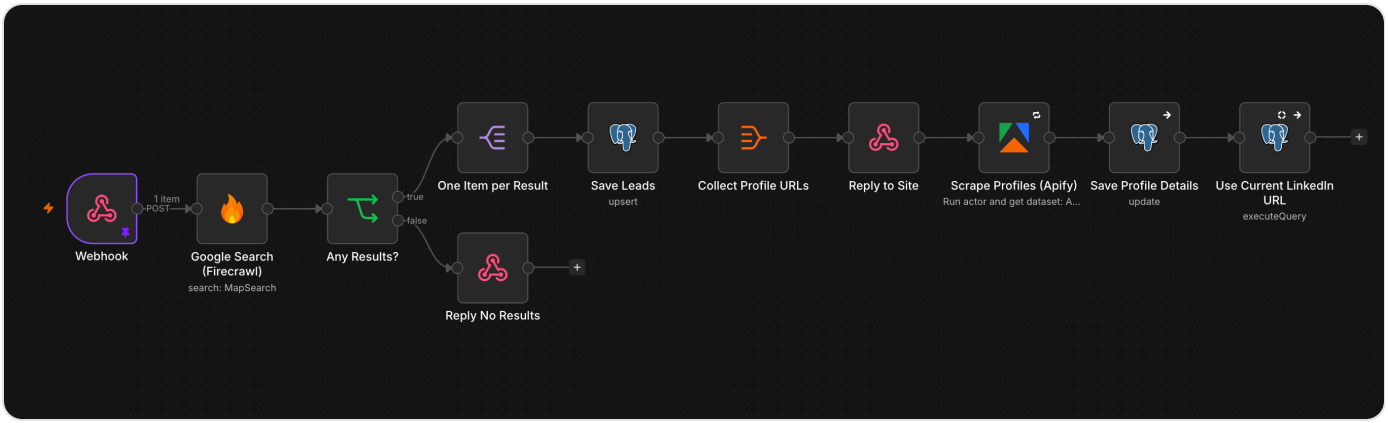

There is no custom backend server. The site is a React app on Vercel, and the work happens in two n8n workflows that I self-host. The browser never talks to n8n directly; every request goes through a small Supabase function first.

Browser	Gatekeeper	Workflows	Services
React app on Vercel	Supabase Edge Function: checks input, rate limits	n8n, self-hosted on Oracle Cloud	Firecrawl to search, Apify for profiles, Gemini to score

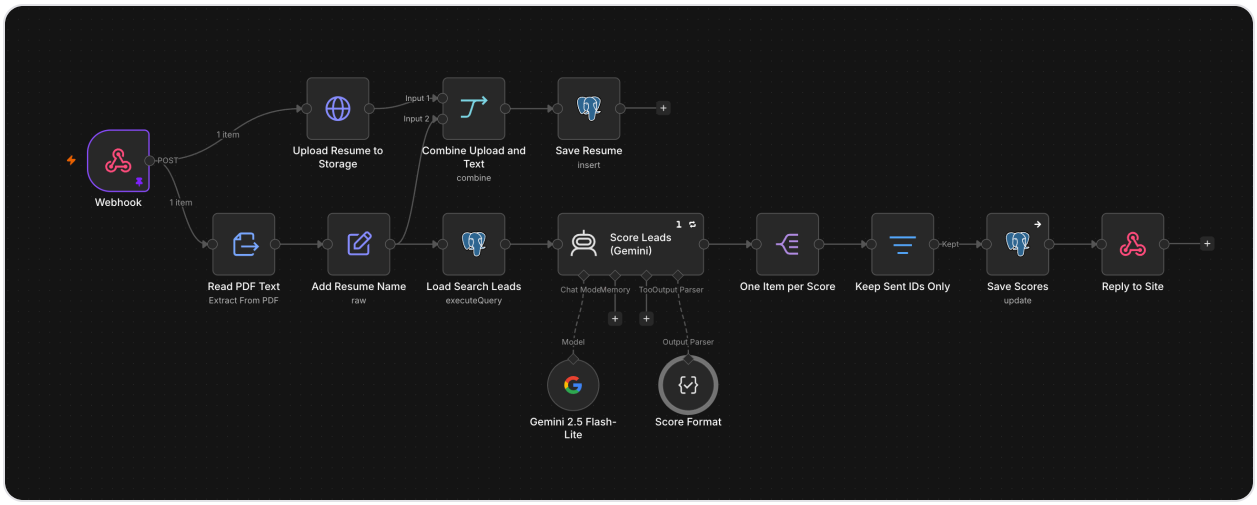

Results are saved to Supabase Postgres, and the site reads them back from there.

Searching. n8n runs a web search for public LinkedIn profiles at the company, saves the people it finds and replies to the site straight away. It then fetches each person's full profile in the background.

Scoring. n8n pulls the text out of the resume and sends it to Gemini along with each profile, labelled with its database ID. Gemini returns a score and a reason for each ID, and n8n saves them.

The search workflow in n8n.

The scoring workflow in n8n.

Numbers

As of October 2026, including my own testing:

95	searches, across 65 companies
363	profiles found
91	resumes scored
133	visitors in four weeks (Vercel Analytics, April 12 to May 10, 2026)
~1 s	until the first people appear, down from 7 to 35 seconds
$0	a month to run

What I left out

There are no accounts and no saved search history. I left both out so I could ship the whole flow end to end first. Searches cover US profiles and return up to four people each, which keeps scraping costs low.

Stack

Frontend	React 18, TypeScript, Vite, Tailwind CSS, on Vercel
Gateway	Supabase Edge Function (Deno)
Workflows	n8n, self-hosted in Docker on Oracle Cloud
AI	Google Gemini 2.5 Flash-Lite, through n8n's AI Agent with structured output
Search and profiles	Firecrawl (web search), Apify (LinkedIn profile scraper)
Data	Supabase Postgres and private storage, with versioned migrations
Checks	GitHub Actions: lint, type check and build on every pull request

The code, database migrations and both n8n workflows are in the GitHub repo, with steps to run your own copy.

About me

I'm Rishav Dutta, AI Product Owner at SquadLocker. I have 6+ years of product management experience across mobility, logistics and e-commerce, at Zoomcar, Blackbuck and IUVA Foods, and an MBA from Simon Business School at the University of Rochester (2026). I built LinkedIn Scout on my own, as product manager, designer and developer.
